

Q4. Cool Word

A word is a string of letters. A cool word has at least 2 different letters and the number of occurrences of each different letter is different. An uppercase letter and the same letter in lowercase are treated as the same. Here is a formal definition of the cool word.

Let w be a word and S be the set of letters in word w .

Then w is cool if and only if for each character c in S , $f(c)$ is different from each other.

Here $f(c)$ means the number of occurrences of c in w .

For example, the word "Ada" is cool because $f('a') = 2$, $f('d') = 1$, and they are different. "BANANA" is also cool because $f('a') = 3$, $f('n') = 2$, $f('b') = 1$. But the word "Bbaccdd" is not cool because $f('a') = f('d') = 1$. Some other interesting cool words include: Mammal, Needed, Papaya, Referee, Senselessness.

Input:

You have to read a file named "words.txt". There will be at most 30 lines of test cases. Each line contains a string containing at least one and at most 30 letters.

Output:

For each test case, you have to print one line containing "Yes" if the test case is a cool word or "No" if the test case isn't a cool word.

Input example:

Ada
Bbaccdd
BANANA
Mammal
Abba
Needed
Illness
Adidas
Papaya
Referee
Didadi
A
Abcdeabcdeababcdabcaba
An
Senselessness

Output Example:

Yes

No

Yes

Yes

No

Yes

No

No

Yes

Yes

Yes

No

Yes

No

Yes
